

Station 2: Wind & Weathering

Can wind move Earth materials?

Procedure:

Part A - Size Matters:

1. Place three small piles in separate areas: fine sand, pebbles, larger rocks
2. Use fan on LOW setting - aim at each pile for 10 seconds
3. Observe: Which materials moved? Which stayed?
4. Try fan on HIGH - what changes?

Part B - Protection Test:

1. Make two identical sand piles side by side
2. Place small "trees" (twigs) around ONE pile
3. Blow fan at both for 20 seconds
4. Compare: Which pile eroded more?

Record in Your Journal:

- Which size particles moved easiest?
- How far did sand travel compared to pebbles?
- Did the "trees" protect the soil? How?
- Draw what the wind-blown area looks like

Real World: Wind creates sand dunes and dust storms! Farmers plant trees as "windbreaks" to protect their soil, just like your model.
