

Station 3: Slope & Water Flow

Does slope steepness affect erosion?

Procedure:

Test 1 - Gentle Slope (15°):

1. Fill tray with loose soil/sand mix
2. Prop up one end with 1 book (gentle slope)
3. Place cup at bottom to catch sediment
4. Pour 200 mL water slowly from top
5. Measure sediment collected in cup

Test 2 - Steep Slope (45°):

1. Refill tray with same amount of soil
2. Prop up with 3 books (steep slope)
3. Pour same amount of water
4. Measure sediment collected
5. Compare the results!

Record in Your Journal:

Slope Angle	Sediment (spoons)	Observations
15° (gentle)	_____	_____
45° (steep)	_____	_____

Real World: Steep hillsides lose soil much faster than gentle slopes! This is why landslides happen on mountains after heavy rain.
